Sales vs Refunds by Year

Refund Rate by Product

Sales and Refund Analysis

Key Findings

1.) Mobile Conversion is Lower

Desktop visitors convert at 8.5%, compared with 3.1% for mobile visitors—a gap of 5.4 percentage points. This suggests that mobile visitors are less likely to complete a purchase.

Recommended action: Review the mobile shopping experience, page-loading speed, and checkout process to identify potential barriers to purchase.

2.) The Original Mr. Fuzzy Leads Product Sales

The Original Mr. Fuzzy generated approximately $1.211 million in sales, making it the leading product in the dashboard's product-sales comparison. Its strong sales performance makes it an important product to examine when evaluating revenue drivers.

Recommended action: Analyse its sales volume, pricing, marketing traffic, and refund rate to understand what contributes to its performance.

3.) Purchase Completion Is a Key Opportunity

The dashboard records approximately 473K website sessions and 32K purchase sessions, representing an overall session conversion rate of around 6.8%. The funnel provides a starting point for identifying where visitor engagement declines during the purchasing journey.

Recommended action: Validate the sequential funnel calculations and compare the number of sessions progressing between each stage to identify the largest opportunities for improvement.

4.) Refunds Should Be Monitored Alongside Sales

The dashboard shows approximately $1.076 million in sales and $48K in refunds for 2014. Reviewing refunds alongside sales can help identify products or periods that warrant further investigation.

Recommended action: Compare refund rates across products and periods, and investigate refund reasons where the relevant data is available.
